# Multiboxing - A Guide

v1.0.1

---

Ackbad Pappotte

January 4, 2025

## 1 Introduction

---

Multiboxing is the time honored tradition of creating friends to play with in lieu of actually befriending people. This guide aims to be a relatively comprehensive look at the process, relevant to running both your 2nd character and your 20th character. This means that you should not feel obligated to follow everything outlined in this guide. If you're only running 2 charters for example throttling the FPS of inactive clients isn't particularly helpful for example. If you find anything incomplete or incorrect, please reach out so I may fix the issue. Finally, this guide is meant to only cover multi boxing, not alts in general. The latter is far outside of the scope of this guide and as such is left as an exercise for the reader.

### 1.1 Quickstart Checklist

1. Create account via a [refer a friend link](#).
2. Move to Jita, buy [this](#) skill plan and start it.
3. Add the new character to your multibox profile in the launcher.
4. Copy over window layout via the [CopyEveLayoutTool](#).
5. Install [EVE-O Preview](#).
6. [Configure](#) EVE-O Preview.

## 2 Out of Game Setup

---

### 2.1 The Rules

What is not allowed:

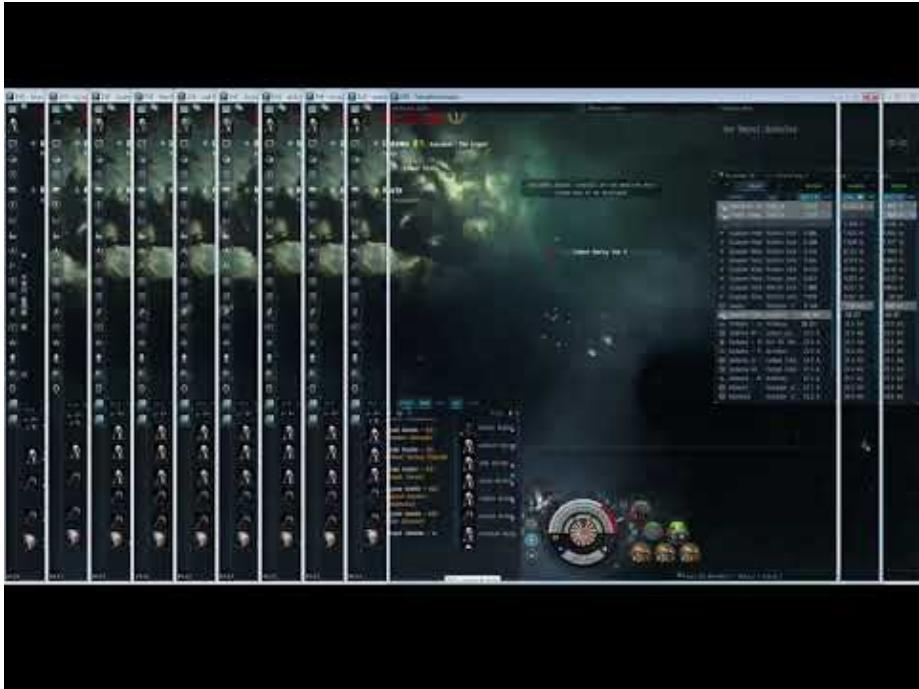

- Input Broadcasting ie. copying one input across multiple clients. Every input can only correspond to one action on a single client (the one exception is if you're using [slash command](#) to queue up commands such as when smartbombing shuttles).
- No cutting up the client. You can shrink, resize, and reduce the framerate of a client, but you cannot cut it up.

An example of a cut up client.

It is worth noting that both of these were once allowed, so particularly old resources and screenshots may reference these now banned techniques.

## 2.2 Tools

Multiboxing without a client manager.

- [EVE-O Preview](#), Download the latest version [here](#)  
This is the most popular tool by far because it's both free and build specifically for EVE. It runs on Windows natively, and on Linus though Wine. It dose not yet work on Mac.
- [ISBoxer](#)  
This is the main alternative to EVE-O. It is a program that is designed to work across many games, but costs 50\$/year. It is generally more powerful letting you configure the resources used by inactive clients, and also allows for bannable techniques such as input broadcasting. A guide to setting it up for EVE can be found [here](#).
- [GURU3D RTSS](#) FPS throttler.  
this is a tool to throttle the fps of inactive clients on windows. While windows dose this automatically for minimized clients, if you just swap windows it doesn't always happen. This tool also lets you specify the fps of inactive clients. A guide to stetting it up for EVE can be found [here](#).
- [CopyEveLayoutTool](#)  
[Instructions to do it manually](#)  
Linux/Steam file location: `~/.local/share/Steam/steamapps/compatdata/8500/pfx/drive_c/users/steamuser/AppData/Local/CCP/EVE`

## 2.3 EVE-O Preview Setup

One of the most important things in multi-boxing is a proper window layout. If you don't want to use eve-o, you can find a good example of how to stack windows [here](#), but this guide assumes you are using eve-o.

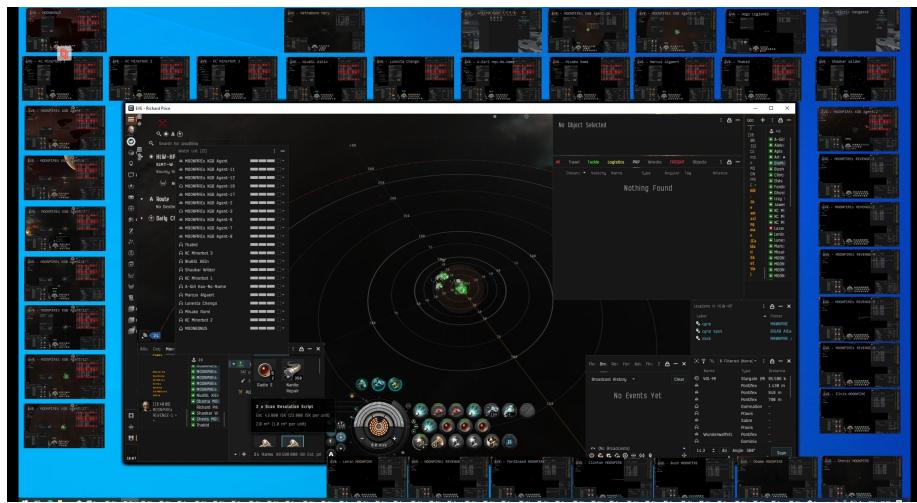

Here is a list of settings I recommend enabling, if I don't mention it I recommend having it disabled:

- Track client locations - A no-brainer, it ensure a consistent window layout between play secessions.
- Minimize inactive EVE clients - It helps reduce the resource requirements of any client you're not actively looking at.
- Previews always on top - If you plan to stack windows above your EVE client this is necessary
- Show Overlay - Shows client names. Not necessary but nice if you don't have your layout memorized
- Highlight active client - Key if you're running many clients, it help you know which one's up at a glance.

There are also several setting you should absolutely set that require you to modify the config.json file EVE-O uses. The main two are hotkeys for each client and a cycle group. These are one of the largest draws of using EVE-O as it lets you swap clients without the mouse, something crucial if you want to multibox in anger. If you open the config.json file (located in the same directory as the EVE-O.exe) you will see examples you can copy for your own settings. If you are unsure of the window/character name EVE-O is expecting simply log into the character with EVE-O running and it will generate a settings block at the bottom of the json that includes the window name, location, size, etc. you can copy from. Personally I like assigning specific clients to keys 1-0 and the cycle button to mouse button 6, but this isn't always ideal. Keep in mind that EVE-O will eat any input that swaps clients, so if you assign a client a hotkey you won't be able to for example type with that key while EVE-O is running. If you are unsure on how to set any of these settings, the [EVE-O github](#) goes into greater detail on how to set them.

## 2.4 Hotkeys

If you want to run more then maybe 2 clients you need to setup and learn to use hotkeys as it allows you to minimize mouse movement. Particularly if you're running more then 2-3 clients, often you'll be using your mouse to switch clients so you'll need to use hotkeys so that you don't need to move your mouse across the screen and back every time you swap to a client to do some input like activating your guns.

Example layout

While this is an extreme example, you can see how far the mouse would need to move from selecting a client with your mouse, click a mod, then select the next client.

My setup:

- 1-0: EVE-O switch client
- Q, W, E, R: High-Slots 1-4
- A, S, D: Mid-Slots 1-3
- Z, X, C: Low-Slots 1-3
- F: Lock Target (and pay respects)
- V: D-Scan
- T: Launch Drones
- G: Drones Engage Target

- B: Recall Drones to Drone Bay
- Y: Broadcast Shield
- H: Broadcast Armor
- N: Broadcast Capacitor
- Mouse Button 4 (Thumb 1): Overheat Modifier Key (shift)
- Mouse Button 5 (Thumb 2): Broadcast Target (ctrl)

This setup runs into issues with ships like nestors or curses where you can easily have more than 10 active mods, it is optimized specifically for running 1-3 ships in a nano-gang. The reach to broadcast for reps is not ideal either. You don't need to copy this setup, but you should spend some time to think out your hotkeys as the defaults are generally terrible.

## 2.5 Window Layout

Here are two example layouts for eve-o windows. There are many other ways of doing it but these two are the most common and simple.

Clients at the top.

This is the most common setup you'll see in videos and for good reason. It is taking advantage of the usually empty space at the top of the game client to position the windows. This space is almost always empty (unless you put the capacitor at the top), and is within easy reach of the mouse if you prefer to switch clients that way, being a similar distance from the center of the screen as other EVE UI elements. While the clients in this image are relatively large, it's not unreasonable to put 10 or more windows in that area if you re-size them properly, as in such cases the windows are less a button to click and more an indicator of which client is active.

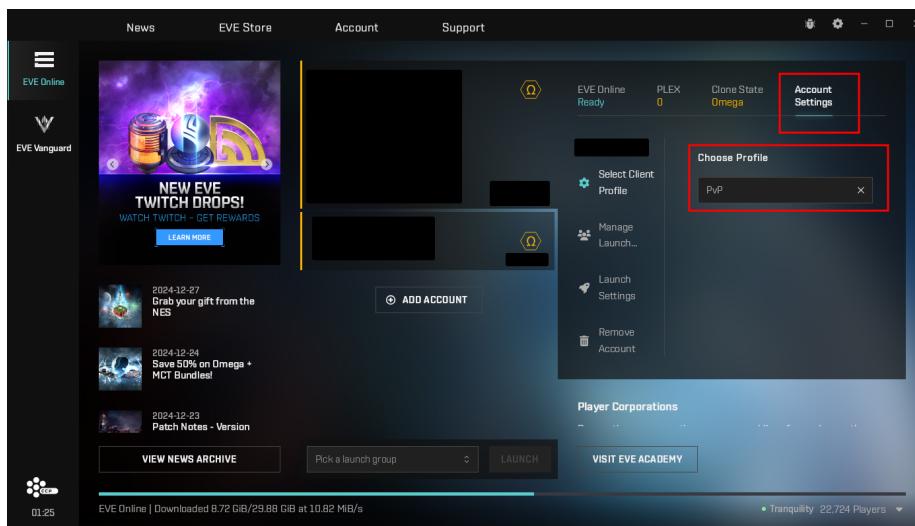

Clients at the top.

This is an alternative setup that I used for many years. Personally I found it better for differentiating at a glance which window is which client, but it dose put the windows a bit further out of reach. It dose however ave the advantage of keeping the top left portion of the client clear of eve-o character selection window previews, as they will default to that location whenever you open a new client, which can block the neocom menu, search bar, and any other elements you keep at the top left corner of the client.

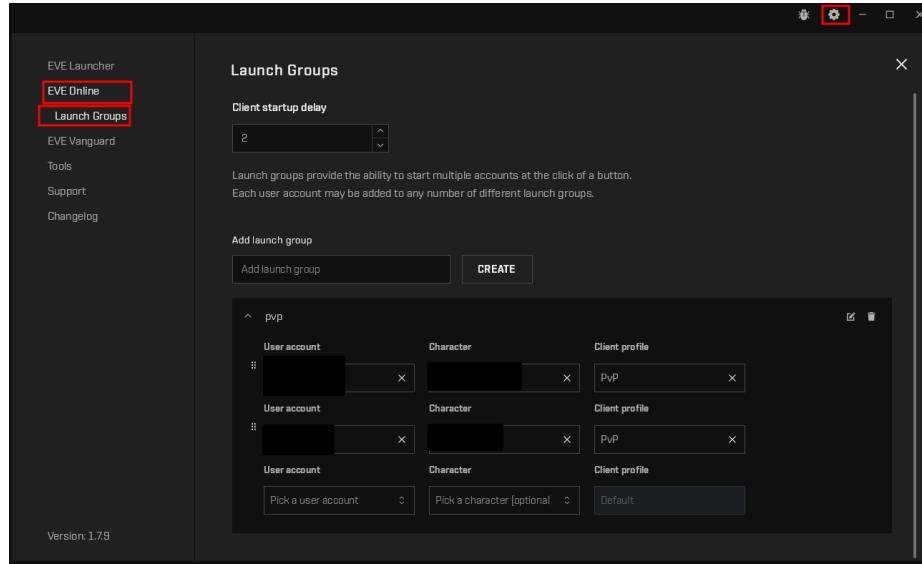

## 2.6 Profiles

Profiles are a tool built into the EVE launcher that let you save and swap client settings/layouts. They also combine with launcher groups to let you launch multiple clients with a single click, either to the character select or strait to a specific character. To create a profile go to the EVE launcher, select an account, then the account settings tab.

Profile Location

Then click on the box to select a profile or create a new one. When you login with this profile you will have the default UI. You can setup your UI however you want, and then close the client. You can create multiple different profiles this way, each with a distinct layout and hotkeys (though personally I recommend keeping those consistent across layouts). You can then assign multiple clients to a launcher group in the settings window.

The Launcher Groups Page

Assigning multiple accounts here will let you say launch all your accounts need for a large fleet fight with the fleet fight profile. It is also very nice when you need to launch all your accounts for a login regard or for extracting (just don't crash your pc trying to launch 50 at once).

Once you have created a profile you like for one account, log into that profile with every other character and account you want to add it to. Instead of manually setting everything up every time however, you can use the [CopyEve-LayoutTool](#) instead to clone it. Alternatively you can manually copy settings by following the guide [here](#). There is also [EANM](#), a settings manager to clone your settings to different clients more generally.

## 2.7 Tips and Tricks

- A personal chat channel for all your alts. Not only does this make finding character names for trading and sending isk far easier, but the MOTD can also be used to save things like a shared overview that is even accessible if you swap computers.
- Bright overview colors. If you want to use the mini client windows provided by EVE-O as eyes, it helps to set all pilots to a default bright color so they are more visible in the shrunken down window. Personally I use a solid yellow background for all characters that have no standing so neutrals are more easily visible but still stand out among reds and blues.
- When fleet-warping alts around, you can queue up jumping though the gate mid-warp. Just initiate the fleet warp then for every client press jump in the selected item window mid-warp and they will all jump on contact with the gate.

## 3 Character Setup

---

### 3.1 Character Creation

To create an account, you'll first need a recruitment link. You can get the recruitment bonus SP retroactively, but you may as well do it now. You can generate your own link [here](#), or if you can't be bothered you can use [mine](#). Aside from the bonus SP, whoever generated the link gets minor bonuses if the character created though it buys PLEX or Omega time with cash.

Next, you want to create a Caldari character with any bloodline and the School of Applied Knowledge background. You do this because it spawns you closest to Jita. Other races may be slightly better in terms of starting skills, but that's at most 10-15m of extra training so I prefer the closer Jita start.

### 3.2 General Skill Plan

For early training, I would prioritize 3 things, flying a stiletto, flying a hound, and core skills. The below skill plan will train those 3 things reasonably well, but skips drone and gun skills. There are many other more specialized roles you may want to train an alt into as well such as links, logi, ewar, hauling, etc. But an extra tackle/eyes ship and an extra bomber are the two most universally useful and easily trained into. It may also be worth re-mapping to optimize this skill plan, but personally I wouldn't recommend any remap beyond dumping Social for the other 4 attributes for such a short plan. If you're going to do so though drop the plan in [EVE Mon](#) to sort the plan by attribute. Another thing to watch out for is event drugs, as they are often a cheap way to trade sp for isk. They are the reason Biology IV is one of the first you train, and they do make Biology V worth it in the long run. Finally, the best way to buy sp for isk is the training boosters in the NES store. While slower, they offer a far better isk/sp ratio than skill injectors (particularly after 5m sp) do, though if you plan to go this route you certainly want to train Biology V.

[General Skill Plan](#)

### **3.3 Alpha Training**

If you are planning on training as an alpha, this is the skill plan I would recommend. The main goal is to get you close to flying a hound and stiletto, with drone and core skills as well as they are so widely applicable. If you are going this route, do not redeem the 1m sp recruitment bonus to the character until after you have finished training, as you can only train to a max of 5m sp on your character sheet, but the bonus sp does not count towards this limit until the 1m sp has been redeemed from your redeem queue. Also, if you do not start training immediately you will need to remove a couple of skills from the end of the queue as it means this plan would put you over 5m sp. The later skills are less important so feel free to drop some as necessary. Finally, get a set of +3 implants. They will improve your training time by approximately 30%, and given that it will take you 5-6 months to reach 5m sp this is a significant gain for implants that cost 20m a piece. +4 and +5s are locked behind omega unfortunately. If you get a couple days of free omega you can inset +5s and retain their benefit while alpha, but free omega is rare enough that this is not worth planning for.

#### [Alpha Skill Plan](#)

### **3.4 Skill Farming**

Skill Farming is something you'll need to do if you don't plan on paying for your alt's subscription out of pocket indefinitely. While you may want to pay for omega initially, eventually you'll run out of skills to train so it becomes worth trading your alt's SP for isk to fund its subscription. You'll want to pick a skill with a long train time, I use Jump Freighters, but Capital Capacitor Emission Systems is another good option with a shorter training time but also fewer requests. You'll want to extract the SP of this skill every month. This can be done remotely so the character does not need to fly back to Jita every month to extract sp. If you want to maximize your skill farming returns you'll need to buy extractors in bulk whenever there is a major sale, and by Omega time ideally when there is a big NES sale but if not buy it in 12 month increments. Generally though it is not a good idea to plan on funding the account purely through skill farming as this also requires you to always sit in a training pod and you need to time the market around unpredictable NES sales. Instead it is better to treat skill farming as a method of reducing the subscription cost of the account which you can then supplement with other activities. Ishtar spinning, PI, and mining are all popular options for this, though there are many more avenues you can pursue. PI in particular had just been updated with templates, making it easier than ever to set up en masse. You can find some very good user created templates [here](#).

## 4 Acknowledgments

---

Ackbad Pappotte with a shameless self-insert.

The fine folks of Noir. for catching my many typos.

Dal, for helping me troubleshoot EVE-O/linux on the [EVE-O discord](#).

Krombopulous Nathan, for showing up with a lutris install scrip out of nowhere.

Want to contribute? Contact Ackbad Pappotte in-game or raise an issue on the [GitHub](#).

## Appendix B: Linux

---

### [Linux Install Guide \(Lutris\)](#)

As of now there is no known way to run EVE-O and EVE through steam at the same time as proton will only let you run one program at a time in a prefix.

Do note some of EVE-O's settings do not work on linux, specifically the one that sets a client's location on startup.

## **Appendix C: Mac**

---

I don't know much about multiboxing EVE on a mac, so if you have advice please reach out so I can add it. You may want to look at [this tool](#), as it is an attempt to create a mac native version of EVE-O, though it is currently still in alpha as of the time of this writing.

## **Appendix D: Skill Plans**

---

Skill plans for alts, let me know if there are any other plans you think should be included.
